

Week 19 Reassessment and Individual Support

Revisit. Refine. Resubmit.

- Targeted revision and catch-up for all students
- Individual and small group support to address assessment gaps
- Focus on building industry-ready skills and confidence

This Week's Objectives

- Identify and address gaps in assessment tasks
- Receive targeted feedback on incomplete or unsatisfactory work
- Revise and resubmit assessments to achieve competency
- Participate in one-on-one or group support sessions

Why Reassessment Matters in AI & ML

- Ensures practical skills meet industry standards
- Solidifies understanding of critical tools like PyTorch, Azure, and distributed ML workflows
- Promotes continuous improvement and confidence before entering the workforce

Assessment Journey Recap

- Weeks 16 to 18: Project implementation, distributed GPU workflows, final documentation, and industry readiness
- Assessments cover; PyTorch fundamentals, GPU/cloud workflows, single and multi-GPU training, and experiment tracking
- Competency builds sequentially; each skill supports advanced industry practice

Most Common Gaps in Assessment Tasks

- Missing or incomplete experiment tracking in distributed training
- Insufficient Bash scripting or cloud automation evidence
- Lack of model documentation or clear code annotations
- Mistakes in configuring Azure GPU VMs or networking
- Limited performance analysis and responsible AI reflection

Revising and Resubmitting Assessments

- Review all feedback provided on assessment tasks
- Address each gap or suggestion with clear, documented corrections
- Test all updated code and ensure it runs in the correct environment
- Submit revised notebooks, scripts, or screenshots as required
- Double-check that all competency requirements are met before resubmission

Industry Focus; Model Monitoring & Responsible AI

- Industry expectations demand robust model monitoring and versioning
- Responsible AI principles require transparent documentation and ethical reflection
- Use this opportunity to showcase industry-ready, reproducible ML work
- Draw connections to real roles in ML engineering and HPC environments

Activity; Self-Check and Peer Feedback

- Use the assessment checklist to self-audit your submission
- Pair with a peer to review code clarity and documentation
- Discuss solutions for gaps in experiment tracking or cloud setup
- Exchange constructive feedback focusing on industry relevance

Individual and Small Group Support

- Book a one-on-one or group session for personalised guidance
- Topics may include; debugging submission errors, clarifying assessment tasks, hands-on bash scripting, or configuring GPU/cloud resources
- Flexible scheduling and support to ensure every student has an opportunity for improvement

Practical Example - Revising a PyTorch Submission

- Revisit incomplete or incorrect PyTorch scripts from Week 16 or 17
- Example; Tensor operations not correctly using GPU with `.to("cuda")`
- Revise code and add clear comments. Test GPU availability in the script.
- Document changes and resubmit updated code notebook for reassessment

Submission Checklist

- All code runs without errors in the target environment
- Screenshots or logs attached to demonstrate outputs where required
- Model documentation and experiment tracking sections are complete
- All feedback addressed and improvements clearly annotated
- Submission uploaded through the required LMS or cloud drive

Next Steps and Course Completion

- Ensure all revised work is submitted by the stated reassessment deadline
- Use this week to consolidate understanding and boost confidence
- Prepare for Week 20; Industry preparation, course reflection, and final wrap-up
- Reach out early for support; success is built through persistence and teamwork
